

Donna Miller

I am a grandmother and am so thankful common core math was NOT being used when my children were in school. I have watched my granddaughter struggle three hours every night with math homework alone and still does not understand it. She is ten years old and spends a good part of the day in school (public school system.) She is a very bright girl in all other areas so this tells me that if a bright child who spends three hours every school night working on math and still does not understand it, something needs to be re-evaluated. And my understanding is that this is what almost all of the children are going through. Why are we putting such a heavy burden on these young children? Learning math is so important, and the basics of arithmetic is what children need to learn according to age. I strongly support removing common core math as I do not see it producing good results. Thank you.
